Let's Start!

Why do you need a computer or an information system?

Learning Outcome:

Identify key information about people's jobs and places of work in spoken or written contexts.

Design the data structure, starting from the conceptual model determined in the systems analysis, using database IT tools, according to regulation and established standards.

Can Do Statements:

- I can read about computers and information systems.
- I can write information to summarize a specific topic.
- I can explain the difference between computers and info systems by writing meaningful sentences.

Ask your partner:

- What elements do you need to install a successful information system in your company or education center?
- What information system does your company have?

Let's Explore!

Two IT students are reading and talking about what they find in a magazine about their career.

Instructions: Read the text below.

- Paola:** I've found an interesting article in a tech magazine about computers and information systems for our class. Shall I read it?
- Christian:** All right. But if you read it, can you read it slowly so that I can get it?
- Paola:** Okay. There's a lot of information in this magazine, so I'll just read some key parts.
- Christian:** Go ahead and do your best. If you don't make any mistakes while reading, I'll take some clear notes.
- Paola:** Fine, here I go. "Many people, even those at a business environment, might think that a computer and an information system are almost the same simply because both process information, but this is far from certain. A computer is just a small piece within an information system that serves the purpose of transforming data into useful information. An information system, on the other hand, consists of a set of computers, robust databases for transactions and other operations; a few operating and application software packages; a lot of peripheral devices like printers, photocopiers, scanners, projectors, etc.; and a large number of people resources as IT specialists and end users, and, finally, network resources that may include servers, wired/wireless routers, modems, data cables, switches and so on. The picture to the right illustrates this point."
- Christian:** One moment, what picture?
- Paola:** This one. Have a look at it. Hey, if you don't take any notes, how will we summarize all this info?
- Christian:** Okay, give me a sec. That's it, ready. Excuse me Paola, let's have a short break, I must go to the bathroom.
- Paola:** No problem.
- Christian:** I'm back. So, the difference is that an information system contains many computers as one of its main elements,, but there are many more elements that an information system comprises.
- Paola:** Yeah, that's right.

**Let's Practice!**

Let's prepare our presentation!

Instructions: Underline all the modal verbs. Practice reading the conversation aloud with a partner. Check your pronunciation with your instructor.

Paola: Ok Christian, I already read the text. Could you take notes?

Christian: Sure! I think we can already explain the difference between computers and info systems.

Paola: Well, what might we say when we have the presentation? Can you read please?

Christian: Well, I wrote that the difference is: computers are an element from information systems and there are more other elements that together make the information system possible.

**Let's Practice!**

Let's make a summary about this topic!

Instructions: Classify the halves in the boxes according to their category.

a set of computers, robust databases for transactions and other operations / a few operating and application software packages / a lot of peripheral devices like printers, / photocopiers, scanners, projectors, and so on / a small piece within an information system / serves to transforming data into useful information

An information system consists of

Computer features

processes information

Extension Activity

What is the difference among the different resources in information system?

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for information about the different resources in information systems.
- Identify positive and negative aspects of each one.
- Make a comparative chart explaining the difference among the resources in information system.
- Share your comparative chart with your class and discuss about the topic.

Self-Assessment

Yes

No

- I search for information about different resources in information system. ☐ ☐
- I identify positive and negative aspects of resources in information system. ☐ ☐
- I make a comparative chart explaining the differences among the resources in information system. ☐ ☐
- I share information and discuss about resources in information system. ☐ ☐

Target Words

- **key part** (noun): a very important element, piece, section or component of something
e.g. There's a lot of information in this magazine, so I'll just read some key parts.
- **shall** (modal verb): in a question shall is used to make an offer, a suggestion or to ask for advice
e.g. Shall I read it?
- **this is far from certain** (expression): expression used to state that something is not as it has been affirmed or declared
e.g. Many people, even those at a business environment, might think that a computer and an information system are almost the same simply because both process information, but this is far from certain.
- **give somebody a sec** (expression): expression used to ask somebody to wait for a moment
e.g. Okay, give me a sec. That's it, ready.
- **on the other hand** (conjunction): opposed to what was previously said or exposed
e.g. An information system, on the other hand, consists of a set of computers, robust databases for transactions and other operations.
- **tech magazine** (noun): a publication with specialized information about technology, technology applications and computers
e.g. I've found an interesting article in a tech magazine about computers and information systems for our class.

Learning Points

The first conditional in affirmative

These are some types of conditional phrases in English. Some are possible, others are unlikely while others are impossible. **The first conditional** deals with real conditions with a possible or imagined future consequence or result.

The first conditional is composed by two clauses. One of them is the likely condition and the other clause is the imagined future consequence or result. It doesn't matter which clause you use first, but in case you begin with the conditional clause, a comma must be placed at the end of it before the second sentence.

Example:

If we want to make good and informed decisions, we will have to invest in a solid information system.

We will have to invest in a solid information system if we want to make good and informed decisions.

As you can notice, in the second example the coma is not placed after the first clause because it starts with the possible future consequence.

Conditional clause

The word **if** is widely used in the conditional clause. However, it is not the only way. Other words in replacement of **if** are:

- unless (if not)
- so long as
- as soon as (the moment)
- provided that (on the condition that / only if)
- whether (if)
- after
- before
- when

Examples:

Unless we finish this project on time, we **may** likely **assume** 15% of additional expenses.

After having a comprehensive and approved plan, we **will_start** implementation of the new information system.

Whether to help you succeed in the exam I have to prepare you for over a week, I'll do it.

Grammar structure

The grammatical structure for the first conditional is pretty simple.

Learning Points

If + subject + verb (present) + complement, (Clause 1)

subject + will/may/might/can + complement (Clause 2)

We use **will** in the consequence or result clause to state that we believe the result will be definite or certain to happen. When we feel not so sure, we can use **may/might** to state that the result is still possible but not definite.

Example:

*We **will need to purchase** two new laptops, a printer and a router if these machines don't work.*

*If after the test these second-hand machines work but not so well, we **may need to purchase** a laptop, a printer or a router.*

Examples

- *If you read it, can you read it slowly so that I will get it?*
- *If you don't make any mistakes while reading, I'll take some clear notes.*
- *Hey, if you don't take any notes, how will we summarize all this info?*

Functional language, Make, Do, Have, Take

Collocations refer to the natural and regular use of some words that go together. People who have spoken the language all their lives recognize them as natural and identify their order easily.

Though there are many synonyms for a word we can use to express an idea and also to avoid redundancy, only some of them can go together and sound natural in a natural in any language. That is what linguists have called **collocations**.

Now let's take a look at some common **collocations** used in English for business and social contexts in connection with the verbs **make**, **do**, **have** and **take** in the table below:

do one's best, make the best of, have the best: If you **do your best**, it means you have acted correctly and that no-one can expect more from you. **To make the best of a situation** means to take as much advantage as possible from a bad situation. See take advantage. **To have the best** is to be in possession of the best of something.

Learning Points

make a mistake: to make an error.

make notes, take notes: to make or **take notes** is to write the notes, usually to record on paper what someone is saying.

take a look, have a look: to take or **have a look** at something means to look at it (with purpose).

do business, make business, take business, have business: to do business means to agree a commercial contract. **To have business with someone** means to have matters to be settled with that person. **To take business** is to deprive a competitor of a customer by acquiring that customer. **To make business** is to create a business opportunity.

make an appointment, have an appointment: to make an appointment means to organize a meeting with other people. **To have an appointment** means you are to participate in a meeting with other people.

make an argument, have an argument: to have an argument with someone means to argue with that person. **To make an argument** for something means to present a logical argument in its favor.

take action: to take action means to act positively and decisively to resolve a problem.

take advantage, take advantage of, have an advantage: to take advantage of something or someone means to profit from the momentary situation of the person or thing. **To have an advantage** means to be in a better position than someone else.

Examples

- *Go ahead and do your best.*
- *If you don't make any mistakes while reading, I'll take some clear notes.*
- *Have a look at it.*
- *Excuse me Pao, let's have a short break, I must go to the bathroom.*
