Let's Start!

Information technology boosts information systems.

Learning Outcome:

Identify key information about people's jobs and places of work in spoken or written contexts.

Design the technological architecture of the IT system, through hardware and software recognition, based on available technology in the market, the analysis report and the distribution diagram.

Can Do Statements:

- I can describe how to improve info systems with technology.
- I can give detailed information about info systems and information technology.
- I can explain the importance of merging information technology and information systems.

Ask your partner:

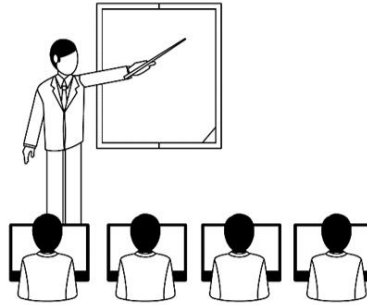

- What is the difference between data and information?
- What technology devices do you think can support the data bases of a company?

Let's Explore!

Professor, Camilla Schwartz, and one of her students are talking about information systems and information technology.

Instructions: Read the text below.

Student: Professor, can an information system be improved when more technology is applied?

Professor: Of course, David. You know, our society is getting more and more advanced day by day, so this will demand for more innovative information systems now and in the future. When recent technologies in an information system are used, it will inevitably get faster and more accurate. A clear example is illustrated by the hundreds of software packages and communications devices used in transaction, decision and learning management systems. When this college, for instance, gets the new learning management system installed, we will be able to process thousands of student requests and other issues in just minutes and not hours as it is happening now.

Student: Excuse me, professor. I got confused. Could I get some examples about information systems and information technology?

Professor: Okay. An information system is designed to help operative and management staff in the collection and processing of data in order to make decisions, process transactions of any kind, to store knowledge in databases for later retrieval and assist them in performing learning and teaching processes.

Student: I've got it now. What about information technology?

Professor: Examples refer to computers of any kind, network technologies, and applicative software, communications equipment, telecommunication machines, other electronic devices and so on. IT technologies in general.

Student: I can see the differences now. I've got another question if you don't mind.

Professor: No problem. Go on.

Student: Does it mean that an information system without technology is unusable?

Professor: Not at all. In fact, an IS can be traced back to thousands of years ago when computers did not even exist. But now our reality is totally different. When using technology in an IS, we will ensure competitiveness and efficiency. I'd say an IS now must be necessarily designed with information technology components.

**Let's Practice!**

What will happen when we implement technology?

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: update, implement, will be able.

1. Information systems will be faster and more accurate when we _____ new technology.
2. For example, when we get the new management system, we _____ to process thousands of students request at the same time.
3. When we _____ our software packages and communication devices, we will help operative and management staff.

**Let's Practice!**

Can IS work without technology?

Instructions: Read the paragraph. Circle the correct words to complete the sentences.

1. I found out that information systems must (having / had / have) information technology.
2. And, implementing technology in IS (provide / can provide / providing) efficiency.
3. In this way, IS might (be / is / are) useful without technology.

**Extension Activity**

What will happen if I use IS and IT in my company?

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for information about information systems and information technology.
- Identify the pros and cons of both IS and IT.
- Write down a paragraph explaining what will happen once a company starts using both IS and IT.
- Share your paragraph with your class and discuss about the topic.

Self-Assessment**Yes****No**

- I search for information about IS and IT.
- I identify pros and cons of both IS and IT.
- I write down a paragraph explaining what will happen when once a company uses starts using both IS and IT.
- I share information and discuss about IS and IT.

☐ ☐☐ ☐☐ ☐☐ ☐**Target Words**

- **get advanced** (verb): to turn into something more technical, more efficient, more modern and productive
e.g. Our society is getting more and more advanced day by day.
- **retrieval** (noun): the act or process of getting back information that has been stored in a computer, hard disk, USB memory, server or cloud
e.g. An information system is designed to help operative and management staff in the collection and processing of data in order to store knowledge in databases for later retrieval.
- **unusable** (adjective): that cannot be used, operated or manipulated
e.g. Does it mean that an information system without technology is unusable?
- **electronic device** (noun): any machine that has been produced to meet a specific need that operates and is controlled with the aid of microchips and transistors
e.g. Examples refer to computers of any kind, network technologies, and applicative software, communications equipment, telecommunication machines, other electronic devices and so on.
- **learning management system** (noun): a system used to instruct learners and to collect and process data related to learners
e.g. When this college, for instance, gets the new learning management system installed, we will be able to process thousands of student requests.

Learning Points

First Conditional Using When

There are different types of conditions in English. Some are possible, others are unlikely, while others are impossible. The **first conditional** refers to a real condition with a possible or imagined future consequence or result.

The **first conditional** has two clauses, one is the likely condition and the other is the imagined future consequence or result.

Example:

*The company **will provide** an exceptional reward **if** we **get** the sought results of this information technology project in time.*

The word **if** is widely used in the conditional clause to indicate that something can be uncertain. However, we can also use the word **when** in the conditional clause when we want to state that if the condition takes place the consequence will definitely happen.

Example:

***When** we **get** the approval of the planning phase of this information system project by the 20th of June, we **will initiate** the implementation phase on the 7th of July.*

This is the grammatical structure for the **first conditional** clauses:

When + subject + **verb in simple present** + complement. (Condition)

Subject + **verb in simple future** + complement. (Result)

It doesn't matter which clause you use first, but in case you begin with the conditional clause, you must place a comma at the end of the first sentence before the beginning of the second one.

Example:

***When** we **buy** the two new laptops, the laser printer, and the router, our LAN network **will be** complete and ready to use.*

*Our LAN network **will be** complete and ready to use **when** we **buy** the two new laptops, the laser printer, and the router.*

Learning Points

Examples

- *When recent technologies in an information system are used, it will inevitably get faster and more accurate.*
- *When this college, for instance, gets the new learning management system installed, we will be able to process thousands of student requests.*

Get: Uses and Expressions

Get is a very common verb in English and has many combinations with adjectives, prepositions, and adverbs to form different meanings and idioms. Such combinations are widely common in informal conversations and informal writing.

Get + Direct Object

In cases when there is a direct object after the verb **get**, it can refer to obtain, buy, or receive something.

Examples:

*I **got** your email. (receive)*

*The company needs to **get** a new information system. (buy)*

*The manager **got** permission to update the databases. (obtain)*

Get + Adjective

When there is an adjective after the verb **get**, it describes a change of state or situation.

Examples:

*My PC **got damaged** this morning.*

*Those systems are overloaded, they are **getting** slower.*

*Those computers are **getting older**. It's time to change them.*

Get + Place

When **get** is next to place expression, preposition or adverb, it means to arrive.

Examples:

*When we **get to the office**, we need to discuss some issues.*

*Did you finally **get there**?*

Examples

- *When recent technologies in an information system are used, it will inevitably get faster and more accurate.*
- *Excuse me professor, I got confused.*
- *Could I get some examples about information systems and information technology?*
