Let's Start!

What type of network do you need?

Learning Outcome:

Identify key information about people's jobs and places of work in spoken or written contexts.

Design the data structure, starting from the conceptual model determined in the systems analysis, using database IT tools, according to regulation and established standards.

Can Do Statements:

- I can describe network resources in information systems.
- I can compare different resources that take part in info systems.
- I can summarize information related to network resources in info systems.

Ask your partner:

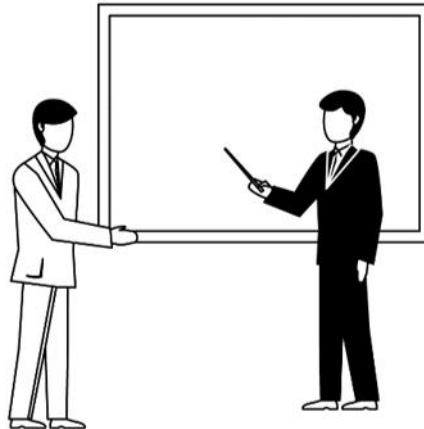

- What devices do you usually use to connect to the internet? What internet connection do you use with that device?
- What are the benefits of wireless connections?

Let's Explore!

The manager of a company talks to the IT department.

Instructions: Read the text below.

- Trevor:** Diego, we might need to change our network resources. Now that our company is growing, I won't accept any type of system issue.
- Diego:** It might take us longer than we expect to expand our current network but I'm sure the system won't experience systematic failures. Switching from PAN to LAN says a lot about the company.
- Trevor:** Why is that?
- Diego:** As you know, we classify networks by size. A PAN connection is smaller than a LAN connection. With LAN, the company will be able to operate better.
- Trevor:** It is always a good idea to improve our network resources.
- Diego:** Definitely! Now we have better network support resources than before. I am working on a robust LAN computer network with intranet and extranet services. Our offices have stronger wired and wireless connections than the ones we had when we used PAN. Our internet speed won't be slow ever again and this might allow us to increase productivity. I just did a speed test, and the internet is by far faster than ever.
- Trevor:** Excellent. What about the network support resources?
- Diego:** The new technology we are using is more powerful. Our software is up to date and all of our units are in good conditions. We still need to make some changes; don't worry, we are within budget.
- Trevor:** Great. To sum up, we won't have to worry about systematic failures since we expanded our network. We might need to invest money periodically to make sure that our network resources such as our databases, hardware, and software work properly. Now, we are working with a LAN, when we become a big multinational, we will switch to MAN which covers an expanse twenty times bigger.
- Diego:** That's the plan.

Let's Practice!

The company is doing so much better thanks to our network resources.

Instructions: Write the words to correctly complete the sentences. Use words from the box below.

newer / accessible / morepowerful

1. We are implementing _____ databases in our company.
2. The IT department installed a _____ software.
3. We replaced defective hardware and made information more _____.

Let's Practice!

We might need to know more about information systems.

Instructions: Read the paragraph. Write the missing word(s) in the blank. Use: won't worry, might be, won't be, might work.

It _____ a really good idea to improve our network resources so we _____ about systematic failures. A PAN connection _____ fine for some small companies, but it _____ enough for a big one.

Extension Activity

Which resources would you implement in your company?

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for information about network resources in information systems.
- Identify different network resources you would implement in your own company.
- Write down a short paragraph explaining the network resources you will implement in your company.
- Share your paragraph with the class.

Self-Assessment

Yes

No

- I search for information about network resources in information systems.
- I identify and compare different network resources to implement in a company.
- I write a paragraph explaining the network resources I would implement in my own company.
- I share my work with the class.

☐ ☐
☐ ☐
☐ ☐
☐ ☐

Target Words

- systematic failure** (noun): collapse or breakdown of a system
e.g. I'm sure the system won't experience systematic failures.
- by far** (adverb): definitely, undoubtedly, considerably, without a doubt
e.g. I just did a speed test, and the internet is by far faster than ever.
- within budget** (expression): spending an amount of money that doesn't exceed the amount expected
e.g. We still need to make some changes; don't worry, we are within budget.
- expanse** (noun): a large extension of area or territory
e.g. We will switch to MAN which covers an expanse twenty times bigger.
- extranet** (noun): a company's network of computers accessible from the outside with permission of an administrative or IT authority
e.g. I am working on a robust LAN computer network with intranet and extranet services.

Learning Points

Future With Will in Negative Form and the Modal Verb Might

We use **will** in **negative statements** to talk about events we feel are not likely to happen. On the other hand, we can use the modal verb **might** to talk about actions that are likely to happen.

To create statements with **will in negative form**, you just need to follow this grammatical structure:

Subject + **Will Not (Won't)** + Verb + Complement

Examples:

*We **won't** need a LAN connection. Our office is very small.*

*She **won't** use many devices at the same time.*

On the other hand, if we want to express a certain level of probability of a future event, we can use the modal verb **might**. Take a look at the following grammatical structure:

Subject + **Might** + Verb + Complement

Examples:

*We **might** need a faster internet connection.*

*He **might** be interested in switching to LAN.*

We can use sentences with **will not** and sentences along with the modal verb **might** to create statements. Check the following examples:

*We **won't** need a LAN connection, we **might** invest in a PAN connection instead.*

*She **might** have connectivity issues. Those modems **won't** reach all the offices.*

Examples

- *We **might** need to change our network resources. Now that our company is growing, I **won't** accept any type of system issue.*
- *It **might** take us longer than we expect to expand our current network but I'm sure the system **won't** experience systematic failures.*
- *Our internet speed **won't** be slow ever again and this **might** allow us to increase productivity.*

Learning Points

Types of Computer Networks

A computer network is a set of devices connected together to share resources and information. There are different types of networks such as LAN, MAN, WAN, PAN, among others.

We can classify networks by their size. These networks include wired and wireless connections. Sometimes, we can find networks that are completely wired or completely wireless; it all depends on the specific necessities of the users.

Personal Area Network (PAN): This network is the smallest in size and it is very common to find at home or in a small office.

Local Area Network (LAN): Most companies use this network. It is cheap and secure. Some companies rather have wired connections in order to have a faster network.

Metropolitan Area Network (MAN): This is the type of network that you can find in distribution centers, small regions or cities. Some universities with big campuses prefer to have a MAN connection in order to cover all the buildings in it.

Wide Area Network (WAN): This is the biggest one in size. It can cover an entire country, continent or even the whole world.
