Let's Start!

It's time to make your information system more efficient.

Learning Outcome:

Identify key information about people's jobs and places of work in spoken or written contexts.

Design the data structure, starting from the conceptual model determined in the systems analysis, using database IT tools, according to regulation and established standards.

Can Do Statements:

- I can give information about CBIS.
- I can explain what a CBIS is.
- I can classify information related to CBIS.

Ask your partner:

- What do you think it is more common now: a type of information system that is manual or one that is technology-based?
- What kind of computers do you know about? What are their main features?

Let's Explore!

The General and Marketing managers of a very small company are talking about CBIS*.

*"CBIS" stands for Computer Based Information Systems.

Instructions: Read the text below.

General manager:

Alisha, were we doing the fundamental tasks to gain any share in the marketplace last month? Or once again we were losing money. We simply can't go on this way!

Marketing manager:

Yes, I was. However, the problem lies on this obsolete manual information system. You should do something about it!

General manager:

I'm not a technology expert. Have you got any ideas?

Marketing manager:

I'm not an expert either, but I've got some basic knowledge about Computer-Based Information Systems. I guess it may help.

General manager:

Okay, what is it?

Marketing manager:

In my previous job, the company used to manage business information with the CBIS.

General manager:

Was the business operation running well with it?

Marketing manager:

I think so. It is essentially an interconnected system that comprises the hardware which includes, microcomputers, printers, presentation screens, servers, etc.; the software which involves operating systems and application programs; the communications network, that is, fiber-optic cable, coaxial cable, twisted pair wires, servers, communications software, and so on; the data resources that include numeric, alphanumeric, image, audio, and text data and, finally, the people resources related to end users and information systems specialists, analysts, programmers, testers, etc.

General manager:

And how long was it working there?

Marketing manager:

As far as I know, it's still working. Most of the business areas were interconnected with that CBIS system. Thus, planning, decision-making, and controlling were easier to do.

General manager:

What information does it provide?

Marketing manager:

Two kinds of information, the system is fed with data or unprocessed information and the output is useful or processed information mostly utilized for management purposes. The advantage is that end users can get real-time access to that information and databases don't need to be duplicated reducing time and cost at the same time.

Let's Practice!

Why do you know about CBIS?

Instructions: Underline all the past continuous questions in the dialogue.

Sophia: Did you work in the marketplace? Were you doing the necessary tasks to any share in the Marketplace?

Alisha: Yes, but I have a problem with this manual information system. We should do something about it. I have some knowledge about Computer-Based Information System.

Sophia: Really? Why do you know about that? Where you managing business information with a CBIS in your previous job?

Alisha: yes, I used to manage that.

Sophia: Was business operation in your previous company running well?

Alisha: yes, I think so.

Let's Practice!

Which kind of information does CBIS provide?

Instructions: Match the sentence halves from Column A with the ones in Column B. Write each number in the corresponding given space. Read the sentences aloud. Check your pronunciation with your instructor.

COLUMN A

1. The advantage of CBIS is that end users may
2. It is essentially an interconnected system that must
3. The second kind of information is the output or processed information. It can
4. It provides two kinds of information. First, data or unprocessed information

COLUMN B

- a. ____ should go into the system for analysis.
- b. ____ comprise the hardware which includes microcomputers, printers, presentation screens, servers, etc.
- c. ____ be mostly utilized for management purposes.
- d. ____ get real-time access to information and databases don't need to be duplicated.

Extension Activity

How was that company using CBIS in the past?

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for information about CBIS.
- Identify the most relevant aspect of CBIS.
- Search for information about any company that uses CBIS.
- Make a list of questions to ask about how that company was using CBIS in previous years. Take into account the relevant aspects of CBIS and the company you searched for.
- Share your list of questions with your class and discuss possible answers.

Self-Assessment

Yes

No

- I search for information about CBIS.
- I identify relevant aspects of CBIS.
- I search for information about a company that uses CBIS.
- I make a list of questions to ask about how that company was using CBIS in previous years.
- I share and discuss the questions.

Target Words

- share** (noun): a percentage of the total sales market of a product or category of products that rival companies can achieve
e.g. Alisha, were we doing the fundamental tasks to gain any share in the marketplace last month?
- feed** (verb): to supply a machine or system with raw or processed information
e.g. Two kinds of information, the system is fed with data or unprocessed information.
- comprise** (verb): to consist of; to be composed of
e.g. It is essentially an interconnected system that comprises the hardware.
- application program** (noun): any program designed to perform a specialized task
e.g. The software which involves operating systems and application programs.
- decision making** (noun): a thoughtful process of deciding from a pool of options the best alternative to meet an intended objective
e.g. Decision-making and controlling were easier to do.
- lie on** (verb): to rest; to be caused by
e.g. However, the problem lies on this obsolete manual information system.

Learning Points

Past Continuous in Questions

The **Past Continuous** tense has several uses but, generally speaking, it refers to actions that were happening for some time in the past.

The **Past Continuous** tense can be used in affirmative, negative, and **interrogative** forms. This structure can help you express ideas about a past action that took place at a specific time, about two actions that were happening at the same time, or about one action that was occurring before another one.

In the interrogative form, you can use a Wh-question words (what, how, why, when, etc.)

+ to ask for more specific information. Check the next chart:

STRUCTURE	EXAMPLE
Was/were + subject + verb + ing + complement + ?	Were you working in the project last night?
Wh-Question + was/were + subject + verb + ing + complement + ?	Who was explaining you the use of the new information system?

Examples

- *Alisha, were we doing the fundamental tasks to gain any share in the marketplace last month?*
- *Was the business operation running well with it?*
- *And how long was it working there?*

Learning Points

Types of Computers

A computer is a programmable and electronic machine that has revolutionized our world due to its capability of accepting data, storing it for later usage, processing it at high speed, and transforming such data into utilitarian information in any subject, from science to business or education.

Computers are in constant evolution; however, there are some classifications that help to understand them in a better way. Such classification depends on variables like size, function, or usage.

Types Of Computers By Size

Microcomputers: They have been developed for a non-particular use. Examples of microcomputers are laptops, desktops, tablets, in-car computers, smartphones, programmable calculators, and game consoles among the most important.

Mainframe computers: these are robust computers used in large organizations for crucial applications that process massive data such as census, industry and consumer statistics, (ERP) enterprise resource planning, bank transaction processing, and government transaction processing.

Minicomputers: usually known as servers nowadays, these are computers that are larger than a microcomputer but smaller than a mainframe. They have customized features to meet clients' needs for processing and storage capabilities..

Supercomputers: These are the most powerful computers in terms of data processing and performance developed for very specialized and complex tasks that require thousands of calculations at very reliable conditions. They have been used mostly in research and exploration purposes for NASA.

Examples

- *It is essentially an interconnected system that comprises the hardware which includes, microcomputers, printers, presentation screens, servers, etc.*
- *The communications network, that is, fiber-optic cable, coaxial cable, twisted pair wires, servers, communications software, and so on.*

Learning Points

Mainframe Computer and Mini Computer

The correct election for a computer to meet the need of handling a large amount of data is crucial. In that decision-making process, **mainframes and microcomputers** play an important role as optional alternatives.

Mainframes

These are large computers used in large-sized companies such as banks, governmental agencies, or companies with subsidiaries along the country and overseas. The magnitude of data that companies of this size need to manage would be overwhelming if companies don't use computing equipment that is tailored to tasks and projects of this size. In addition, many functions are performed within this type of organizations, from design and product development to statistical data processing coming from marketing campaigns or accounting operations.

Microcomputers They are machines for a more general purposeful use; laptops, desktops, in-car computers, and smartphones are just some examples of microcomputers. Though quick for built-in modern microprocessors, they are not as fast as the speed at which mainframe computers work. Microcomputers' circuits tend to get warm and software tends to freeze when many programs are opened simultaneously. The system works even more slowly when interconnectivity is involved either by video conferencing or streaming.

Example

- *It is essentially an interconnected system that comprises the hardware which includes, microcomputers, printers, presentation screens, servers, etc.*
